

100-175Q SIS

The 100-175 SIS unit has been upgraded to the NEW 100-175Q version. The 2 internal PCB's have been replaced by 1 PCB, which has no relays for a quiet switching operation. Wiring has been simplified as the 0v does not need to be looped. MSU, MSD, DZ and DZR output terminals switch electronically to 0v, when activated via the magnets. See attached wiring diagram;
